REGISTRAR-GENERAL'S OFFICE, ONTARIO,

TORONTO, December 23rd, 1883.

To His Honour the Honourable John Beverley Robinson,

Lieutenant-Governor of the Province of Ontario.

MAY IT PLEASE YOUR HONOUR:

In compliance with the Statute in that behalf, the undersigned respectfully presents to Your Honour the Annual Report of Births, Marriages and Deaths for the year ending 31st December, 1882.

Respectfully submitted,

ARTHUR S. HARDY,

Registrar-General.

## REPORT

RELATING TO THE

# Registration of Births, Marriages, and Peaths

IN THE

## PROVINCE OF ONTARIO,

## FOR THE YEAR ENDING 31st DECEMBER, 1882.

PARLIAMENT BUILDINGS,

Toronto, December 23rd, 1883.

To the Honourable A. S. HARDY,

Registrar-General, Province of Ontario.

SIR,—I have the honour to submit the Annual Report relating to the Registration of Births, Marriages and Deaths, in the Province during the year ending 31st December, 1882.

The total number of Births, Marriages and Deaths, registered during the year 1882, was 77,678, an increase of 1,037, or 1.3 per cent. over the number registered in 1881.

The number of Births registered was 42,429, as against 40,714 in 1881, shewing an increase of 1,715, or 4.2 per cent. 13,449 Marriages were solemnized in 1882, an increase of 343, or 2.6 per cent., over the number registered in 1881. The number of Deaths recorded during the year 1882 was 21,800. In 1881, the number returned was 22,821, shewing a decrease of 1,021, or 4.4 per cent.

TABLE I.—Table Shewing the Total Number of Births, Marriages, and Degrease.

Ontario in 1882, with the Increase and Degrease.

<sup>+</sup> Yorkville not included, as its incorporation with Toronto did not come into force until Jan. 1883.

### REMARKS ON TABLES 1, 2, AND 3.

These tables contain the number of births, marriages, and deaths registered in Ontario in 1882; the full particulars will be found in the Appendix to this Report.

#### BIRTHS.

Increased returns of births over those of 1881 have been received from 25 of the 39 counties.

The ratio of births to 1,000 persons living is 22, and fifteen counties return a higher

ratio and 24 a lower.

The State of Rhode Island, in which registration laws have been in operation for 28 years, shew by their reports a ratio of 24 births to 1,000 of the population.

In Vermont, registration laws have been in force since 1857; the birth rate of this

State, according to their reports, is 21 per 1,000.

In Massachusetts, the registration of vital statistics has been carried on since 1850. Their reports shew a birth rate of 23 per 1,000, so it will be observed that the number of births registered in Ontario compares favourably with the numbers registered in these States, especially when it is considered that many of the counties in Ontario have been settled very recently, and it is found difficult to get returns from sparsely settled districts. The returns shew that there was in the whole Province one birth to every 45 of the population. In several counties this proportion was exceeded: thus Carleton returned one birth to every 35.5 of its population; Essex, Prescott and Russell, (united) and Waterloo, one in every 34; Wentworth, one in every 39.6; York, one in every 36.2. In some of the other counties the proportion was less. Elgin only returned one birth to every 60 of the population; Hastings, one in every 58.6; Northumberland and Durham (united), one in every 56.6; and Stormont, Dundas, and Glengarry (united), one in every 64.4 of the population.

The births registered in the cities and towns are much greater in proportion to popu-

lation than in the whole Province.

The total number of births in these cities and towns was 8,323, or a ratio of 26.2 per 1,000 of the population, a ratio greater by 4.1 than that of the whole Province. This may be accounted for by the fact that registrations are generally more complete in cities and towns than in rural districts.

Much variation is observed in the birth rate even in the cities and towns; in some it was higher than the rate for the whole 26.2 per 1,000, and others lower. Ottawa, for instance, returned a ratio of 38.0 births per 1,000; Milton, a ratio of 33.8 per 1,000; Brampton, 34.2 per 1,000; Pembroke, 46.1 per 1,000; Berlin, 32.6 per 1,000; and Toronto, 30 per 1,000, while L'Orignal only returns 11.7 per 1,000, and Orangeville 14 per 1,000. Incomplete registration was doubtless the cause of this low birth rate in these towns.

### MARRIAGES.

There is an increase in the number of marriages registered both in the cities and towns, as well as in the whole Province. Fairly good times doubtless tended to increase

the marriage rate.

The careful registration of the marriages made by clergymen is, however, the principal cause of the now complete registration of this branch of vital statistics; and, if parents, physicians, and others were as conscientious in discharging their duties in reference to the registration of births and deaths as clergymen are to register marriages, the objects for which the Act was established would be attained.

The ratio to population of marriages in the whole Province was 7 per 1,000. In the

cities and towns it was 12.4 per 1,000.

The cause for the higher ratio in the cities and towns has been explained in previous reports, viz., "That parties residing in the rural districts generally resort to the cities

and towns to have their marriages solemnized."

In the counties, Waterloo returned the largest ratio, 9.3 per 1,000. Six counties—Carleton, Hastings, Kent, Middlesex, Wentworth, and York, return 8 per 1,000, all of them except Kent include large cities.

The lowest ratio in any county, 5.3 per 1,000, was returned from Perth. Seven counties had ratios between 5 and 6 per 1,000, viz., Algoma, 5.4; Grey, 5.7; Haldimand,

5.9; Huron, 5.4; Perth, 5.3; Renfrew, 5.9; and Welland, 5.8.

In the returns from the cities and towns, Picton returned the largest ratio of marriages, 24.9 per 1,000, and there are four other towns that returned a marriage rate of over 20 per 1,000, viz., Perth, 23 per 1,000; Napanee, 22.8 per 1,000; Cornwall, 20.6 per 1,000; and Berlin, 20.7 per 1,000. There was only one marriage returned from the town of L'Orignal for 1882. The next lowest returns were from Stratford, 6.4 per 1.000; Brockville, 6.7 per 1,000, and St. Catharines, 6.5 per 1,000.

#### DEATHS.

In 1881 the number of deaths returned was considerably in excess of the previous year (1880). In 1882 there were 1,021 less deaths registered than in 1881. Twelve counties returned an increase in the number of deaths registered, and twenty-seven a decrease. The largest increase returned from any county, 362, was from Carleton. The cause of this very large increase is explained further on in the report. The County of Grey returned an increase of 100 deaths, registered in 1882. Ten other counties also returned larger returns of deaths, although the increases were small. Middlesex returned 389 less deaths registered in 1882 than in 1881. This decrease is more apparent than real; the returns for 1881 were unusually large, owing (as stated in last year's report) "to the sad accident which occurred on the River Thames, near London, in that county, by the upsetting of the steamer 'Victoria,' when nearly 200 persons lost their lives." The death rate for 1882 having returned to its normal state, the decrease is fully accounted for. The following counties also returned fewer deaths in 1882 than in 1881, viz.: Essex, 165 less; Lambton, 115 less; Stormont, Dundas, and Glengarry, (united) 92 less; Ontario, 86 less; Brant, 86 less, and Wentworth, 83 less. The decreases in other counties were small. The ratio of deaths per 1,000 in the whole Province was therefore less in 1882, being 11.3 per 1,000, while in 1881 it was 12. per 1,000.

The returns from the State of Rhode Island shew a death rate of 18 per 1,000,

Michigan 13.9 per 1,000, and Massachusetts, 19.3 per 1,000.

Carleton County returned the highest death rate, 23.6 per 1,000. The Counties of Prince Edward, York, and Wentworth, had an average death rate of 16 per 1,000. The lowest rate of mortality was returned from Algoma, 6.7 per 1,000, but many returns were not received from the unorganized portions of this district; Lanark returned only 7.2 per 1,000, and Elgin only 7.5. The Counties of Bruce, Grey, Lambton, Renfrew, Simcoe and Stormont, Dundas and Glengarry (united), averaged only 8 per 1,000, about one-half of what is supposed to be the actual death rate of Ontario. Turning to Table No. 2, "Return of Deaths from the County Towns," much more reliable data appear to have been furnished, although, in some instances, the death rate returned was unusually large, and in others remarkably low. The total increase in the number of deaths in these places was 69. The largest increase was from the City of Ottawa, 388, and was chiefly caused by the deaths of infants which took place in a lying-in hospital being registered in 1882, whereas, in former years, no returns of any deaths were received from this institution. This increase swelled the death rate to 44.9 per 1000, but as the mothers of these deceased children were only temporary residents of Ottawa it does not appear just that these deaths (which took place so soon after birth), should be taken into account when determining the death rate of the

Toronto and Kingston returned an increase in the number of deaths of 40 and 30 respectively, the other increases in the cities and towns were small in number—7 of the cities and 18 of the towns had less deaths in 1882 than in 1881. The ratio of deaths, to 1,000 of the population, was, in the cities and towns, 19 per 1,000; in 1881 it was

18.8 per 1,000.

The total number of deaths registered in the ten cities was 4,960, this gives a ratio of 21.4 per 1,000 of the population in these places; but this includes the very high ratio, 44.9 per 1,000 returned by Ottawa. Eliminating Ottawa from the list the ratio would shew 18.2 per 1,000. Brampton returned a very high death rate, 30.1 per 1,000.

There are three places where the ratio of deaths was between 20 and 23 per 1,000, viz.: Kingston, 22.2; Brockville, 20.1; Toronto, 20. Two towns, Pembroke and Berlin, had a ratio of 19 per 1,000. The lowest mortality was reported from the three towns

L'Orignal, Walkerton and Welland, 7.0 per 1,000.

There was one death to every 88.2 of the population of the Province. Carleton County returned the largest proportion, one in every 42. Prince Edward and York were the next highest, the former 1 in 60 the latter 1 in 62. Lanark returned the lowest proportion, 1 in every 137.5. The Counties of Elgin, Bruce, Stormont, Dundas, Glengarry (united), Lambton, Grey, Simcoe, and Renfrew were also low, ranging from 1 in 133 to 1 in 120 of the population.

In the cities the proportion was much larger, shewing 1 death in every 52.6 of the population. In Ottawa it was extraordinarily large, 1 death in every 22 of the population; the cause of this has already been explained. Brampton was also high, 1 in every 33.2. L'Orignal only returns 1 in every 142, and Walkerton only 1 in 137, and Welland 1 in every 133.

### (Remarks on Tables 4, 5, 6, 7, 8, 9 and 10.)

The proportion between male and female births in the different months of the year was marked by variations, as in former years. In 1881, August returned the largest proportion of male to female births, 113 males to 100 females. In 1882 the births returned in December shew the greatest difference between the sexes, 118·2 male births to 100 female births. August comes next with 108·9 males to 100 females; there was no difference in the proportion in the months of May and June, 107·9 to 100 being the relation in each month. February is nearly the same 107·0 to 100.

The lowest proportion was in July, 102.8 male births to 100 female births.

For the whole year the difference was 6.6 in favour of the males, that is, of the whole number of births, 42,429, there was 106.6 male births to every 100 female births. March almost invariably returns the greatest number of births, and this year is no exception. June returned the lowest. March returned 3,926 births, and June, 3,130, a difference of 796 in favour of the former month.

November generally returns less births than any month in the year; in 1880 it had

the lowest return but one; in 1881 the lowest, and in 1882 the lowest but one.

The difference between the number of male and female births in the ten cities of Ontario is rather more than in the whole Province, the proportion being 107.8 males to 100 females.

There was also an excess of male births in every month in the whole Province, but in the cities there were more female births than male births in the months of May, October and November. In May there were fourteen more female than male births, in October twenty-six more, and in November ten more.

September was the most prolific month, and June the least so, in the cities.

As usual, the first quarter of the year returned the largest number of births, and the second quarter the least.

The percentages of births in each quarter to the whole number were as follows:—First quarter, 26.2, second quarter, 23.6, third quarter 25.6, and fourth quarter 24.5.

TABLE 11.

1881	748	44	54	66	18.3	384	3	
1882	966	6.6	43	6.6	22.7	389	5	
Average for the eleven years	478	One in every	7 89	Births.	11.5	321	3	

The very large number of illegitimate births registered in 1882, 966, may be attributed to the increased number returned from the city of Ottawa, there having been no less than 319 illegitimate births returned in 1882, whereas in 1881 only eight were so returned. Nearly all these illegitimate births took place in a public institution in Ottawa; had it not been for these returns, the illegitimate birth rate for the whole Province would have been lower than it has been for several years.

The number of pairs of twins reported in 1882 was 389, five more than in 1881, but still eighteen less than in 1880. Five cases of triplets were registered, one in each of the following counties:—Middlesex, Norfolk, Northumberland, and Durham (united),

Oxford and Peterborough.

### (Remarks on Tables 12, 13 and 14.)

There were 343 more marriages recorded in 1882 than in 1881; in all, 13,449 marriages or 26,898 persons married. Of this number, 9,496 (4,686 males and 4,810 females) 35.30 per cent. of the whole number married were Methodists; they far outnumbered any other denomination; Presbyterians come next with 5,469, or 20.33 per cent; Episcopalians follow with 4,673 or 17.37 per cent,; and then Roman Catholics with 3.602, or 13.39 per cent.

December and October maintain the same position, as in former years, of being the favourite months for marrying in Ontario-2,913, or 21.6 per cent. of all the marriages,

were solemnized in these two months.

August and July alternately return the lowest number of marriages. In 1882 August was the lowest. In 1881, July held that position.

The ratio of marriages to 1,000 of the population for 1882, was 7.0.

As is generally the case, those counties in which the cities and towns are situated, returned a larger number of marriages, and a higher ratio than the average of the whole

The Counties of York, Wentworth, Hastings, Middlesex and Carleton, containing the cities of Toronto, Hamilton, London, Belleville and Ottawa, shew a marriage rate of eight to nine per 1,000 of their population, while the Counties of Algoma, Renfrew, Haldimand, Welland and Grey, in which no cities or large towns are situated, returned

only a marriage rate of from five to six per 1,000. (See Table 1.)

The cities returned the largest number of marriages, but have not as large a ratio to population as some of the towns. Toronto, Hamilton, London, Belleville and Ottawa, five of the principal cities, returned a ratio of from eleven to fifteen marriages per 1,000 of the population, while the towns of Picton, Perth, Napanee, Cornwall and Berlin shew a marriage rate of between twenty and twenty-four per 1,000. (See Tables 2 and 3.)

### TABLE 15—MARRIAGES BY AGES.

The proportion of males to females married during the different quinquennial periods of life, for the years 1881-1882, to the whole number of marriages, is shewn in the appended table:—

### MARRIAGES BY AGES.

### (See Table 15.)

Only 175 youths were married under 20 years of age, while no less than 2,808 maidens were united at that early age.

Between 20 and 25 the same relative proportion between males and females continued but not to so great an extent. 6,659 females and 5,072 males were married at that period of life.

In the next period, between 25 and 30 years, the proportion is changed, and now it is found that more young men were married than females; the numbers being 4,758 males to 2,516 females.

Between 30 and 35 this proportion becomes larger—1,657 males to 681 females, and the relation continues the same, in all the remaining periods. The only two periods, therefore, in which the females outnumbered the males were under 20, and between 20 and 25.

### Y See Table 16).

In several instances men were married to women many years their juniors, but few instances occur where women married men more youthful than themselves.

Several cases are reported of persons having been married who had reached the allotted age of life—threescore years and ten. Two couples were married whose united ages in each case were 144. One was a farmer, aged 80, who took a wife aged 64; the other was a clergyman of 76 married to a lady aged 68 years. The greatest disparity in the ages of any one couple married was that of a farmer aged 74, who married a girl of 20 years.

Widowers seem to have been more fortunate in obtaining wives than widows were in finding husbands, as 1,434 widowers were married in 1882, and only 695 widows.

### DEATHS.

### DEATHS

(See Appendix page xxxii to lxxii.)

# TABLE 17.—DEATHS AT DIFFERENT AGES.

The death rate under one year, from one to five, from five to ten, and in each decennial period thereafter, for the years 1875, 1877,

### DEATHS AT DIFFERENT AGES AND MONTHS.

### (See Table 17.)

As the number of deaths registered in the Province in 1882 was 1,021 less than in 1881, a decrease in the several periods of the year will be found, but not in all. Four periods, viz.: from five to ten years, fifteen to twenty, sixty to seventy years, and ninety to one hundred, and over, shew an increase; and it is gratifying to find that the decrease in the number of those who lived to be seventy and upwards, was very small. In 1882, 3,475 persons reached the age of 70, and upwards, against 3,592, in 1881. From eighty to ninety years 1,250 deaths were registered, as compared with 1,269 in 1881; and from ninety to one hundred years, and over, 273 deaths occurred in 1882, and 265 in 1881. The largest decrease in the different periods of the year was "at and under one year," and from "one to five."

### (See Table 18 and 19.)

March is generally the most fatal month in the year. In 1880 it was highest in the list, in 1881 it was third, and in 1882 it has again resumed the highest place, the returned shewing that 1,135 males and 1,041 females, in all 2,176, nearly ten per cent. of all the deaths, were recorded in this month.

The least mortality in any month was in November. In 1881 it was in June.

The first quarter of the year, which includes the fatal month of March, returned more deaths than either of the other quarters. The number registered was 5,930, or 27.2 per cent. of all the deaths in the year. The last quarter recorded the fewest deaths. The difference between the number of deaths registered in the first and second half of the year was considerable; the first half exceeds the second half by 1,040. In 1881 the second half of the year exceeded the first half by 731.

### THE DEATH WAVE OF THE YEAR.

In the years 1880 and 1881 the mortality was low in January; in 1882 it was nearly the highest; therefore, in noticing the death wave from month to month, we commence with the high point in January with a mortality of 1,929, (112 more than in the previous December). In February a fall in the wave appeared, the number of deaths being 104 less than in January; but, if the difference in the length of the months is taken into consideration, the mortality would have been nearly the same in February as in January. A rapid rise in the wave took place in March, where it reached the highest point in the year, 2,176 deaths having been recorded in that month—247 more than in January, and 637 more than in November, the lowest month.

The wave then gradually descended through April and May. In June there was a very marked fall, 389 less deaths than in May, and only 42 more than in the lowest month—

November.

In July the wave ascended, the returns shewing 107 more deaths than in June, and kept rising through August, the increase being 151 deaths in advance of July. The wave then descended gradually through September and October, but made a very rapid descent in November, reaching the lowest point in the year, only 1,539 deaths having been registered in this month—nearly thirty per cent. less than in March, the highest month. A change took place in December, and the wave rose rapidly, and 235 more deaths were reported than in November.

The two special features in the death wave in the year were, first, the high point maintained throughout the first five months of the year. These five months returned 9,839 deaths, or forty-five per cent. of the whole number of deaths; and second, the low mortality in the month of November, only 1,539 deaths, or seven per cent.

being reported during this month.

In 1881 the lowest month was June. It will be seen that in 1882 the greatest mortality in the year was during the wet months of spring. It has been so for several years, but there does not appear to have been a correspondingly high mortality in the fall months, which has usually been the case.

TABLE 20.

The following is a Record of the Ten Highest Causes of Death for the years 1871, 1872, 1873, 1874, 1876, 1877, 1878, 1879, 1880, 1881, and 1882.

### CLASSIFIED CAUSES OF DEATH.

(See Appendix Page xxxii to lxxiii.)

In this report a new classification of diseases has been used; it is similar to the one adopted by the Provincial Board of Health, and is divided into five classes with various sub-divisions.

The following Table shews the names of the different classes, also the number of

deaths in each class with per centages :-

CLASSES.	Deaths, 1882.	Percent'ge to whole number of deaths.	Deaths to 1,000 of population
Class I.—Zymotic diseases	4670	21.4	2.42
Class II.—Constitutional diseases	5715	26.2	3.00
Class III.—Local diseases	7001	32.1	3.64
Class IV.—Developmental diseases	2842	13.1	1.48
Class V.—Violent Deaths	869	4.0	0.45
Cause not specified	703	3.2	0.36
Totals	21800	100.0	11.35

### EXPLANATION OF THE DIFFERENT CLASSES.

CLASS I.—Zymotic diseases, a term proposed by Dr. Farr, and is usually employed as synonymous with preventible, and includes all those diseases such as Measles, Scarlatina, Diphtheria, Dysentery, Cholera Infantum, Bilious, Typhoid, and Typhus fevers and Smallpox, which occur as endemics or epidemics.

CLASS II.—Constitutional diseases, which include Anæmia, Cancer, Rheumatism, Dropsy, Gout, Abscess, Hydrocephalus, Scrofula and Phthisis or Consumption.

CLASS III.—Local diseases, under which are included all those diseases in which the functions of particular organs of the system are disturbed, such as Epilepsy, Apoplexy, Convulsions, Paralysis, Insanity, Heart Disease, Congestion of the Lungs, Bronchitis, Pleurisy, Pneumonia, Disease of the Stomach, Liver and Kidneys, etc.

CLASS IV.—Developmental diseases are those incidental to women, children, and old people.

CLASS V.—Violence, deaths which are caused by wounds, burns, drowning, poison, hanging, suicide, murder, etc.

### REMARKS ON THE DEATHS IN CLASS I.

The deaths from the various diseases in this class numbered 4,670, or 21 per cent. of the total number of deaths.

Diphtheria returned the highest number, 1,239 (606 males and 633 females), an increase of 68 over 1881, and as the number of deaths returned in 1882 was less than in 1881, the increase was comparatively larger. In 1881 the percentage to all deaths was 5.3, in 1882 5.6 The month of January returned the highest mortality from this disease, 165. In 1881 November held that position with 182 deaths; August was the lowest month in both years.

Respecting the ages of those who died from this disease, it is found that more died between the ages of 1 and 15 than in all the other periods of life combined. Five hundred and forty-eight (280 males and 268 females), or 44 per cent. died between 1

and 5 years; 350 (170 males and 180 females), or 28 per cent. died between 5 and 10 years, and 136 or 10 per cent. died between 10 and 15 years, in all, 1,034 or 83 per cent. died from Diphtheria between 1 and 15 years. In 1881 there were 1,171 deaths or 82 per cent. of the whole registered from this disease during the same period.

In the following counties this disease was prevalent:—Elgin returned 29 deaths, or 9.1 per cent. of all the deaths in this county; Leeds and Grenville (united), 79, or 12.2 per cent.; Prince Edward 48, or 13.8 per cent.; Stormont, Dundas and Glengarry, (united), 50 or 9.2 per cent. In the counties of Halton, Huron, Frontenac, Dufferin, and Haldi-

mand, the percentage of deaths from Diphtheria was not quite 4 per cent.

The city of Toronto returned 57 deaths, or 3.2 per cent. from Diphtheria; Ottawa 60, or 4.8 per cent. The town of Picton 16, or 28.5 per cent.; Brockville 25, or 16.1 per cent.; Windsor 10, or 6.7 per cent., while there are several towns which have not returned any deaths from this disease. Diphtheria stands fifth in the ten highest causes of death

in the Province; in 1881 it was fourth.

Typhoid Fever ranks next highest in this class with 555 deaths (318 males and 237 females). The most fatal month was October with 77 deaths, the least so June with only 13 deaths. More deaths from this disease occurred between the ages of 20 and 30 years than in any other period, numbering 148 (83 males and 65 females). The periods 15 to 20 years and 30 to 40 years also returned a high mortality, 74 and 67 respectively. It will thus be seen that the periods ranging from 15 to 40 years returned 289 deaths from this fever, which is 23 more than the total number of deaths in all the other periods.

The county of York returned 84 deaths, or 3.4 per cent. from Typhoid fever; Middlesex, 39 deaths or 3.5 per cent.; Kent, 31 deaths or 5.2 per cent.; Ontario, 30 deaths or 6.0 per cent.; Lambton, 23 or 5.3 per cent.; Oxford, 23 or 3.8 per cent. Although the county of York returned more deaths from this cause than any other county, it does not follow that the disease was more prevalent there, as the percentage was less than in many counties that returned fewer deaths from this cause. The counties of Lanark, Norfolk, Prince Edward, Stormont, Dundas and Glengarry, (united) and

Renfrew reported few deaths from Typhoid fever.

The total number of deaths from this disease in the cities and towns was 191, or 2.8 per cent. of all the deaths. Toronto returned the highest number, 61, but not the highest percentage, being only 3.5, while the town of Sarnia returned only 7 deaths from this disease, but the percentage to the total deaths in that town was 16.2. The numbers returned from London was 22, or 6.9 per cent.; Ottawa, 20 deaths or 1.6 per cent.; Hamilton, 17 deaths or 2.6 per cent. Kingston and Stratford returned each 7 deaths, but the percentages were very different—in Kingston it was only 2.2 of the deaths, in Stratford it was 9.8 per cent. Two cities, St. Catharines and Brantford, and eight towns, Chatham, Brockville, Goderich, Collingwood, Simcoe, Walkerton, Welland, and Milton, do not report any cases of deaths from this fever. The town of Whitby returned 6 deaths with a percentage of 12.7.

The deaths were the most numerous in the months of October, November, December, combined, they numbered 202, or 36 per cent. of all the deaths. The disease stands seventh in the ten highest causes of death in the Province, but last in the list for

the cities and towns.

Scarlet Fever follows Typhoid Fever very closely in numbers. The deaths from it numbered 543, or 2·4 per cent of all the deaths in the Province. The month of March returned the highest number, 99, or 18 per cent. January also returned a large number —77, or 14 per cent. February, May, and June returned 57, 65, and 60 respectively. The first six months of the year was more fatal than the second, 410 deaths being returned for that period, and only 133 for the second half year. The first quarter returned 233 deaths, and the second 177, thus showing that this disease was chiefly confined to the early part of the year.

In noticing the ages of these decedents, it is found that the largest proportion of those who died of this disease were children, 47 died under the age of one year, 300 between the ages of one and five years, and 165 between the ages of five and fifteen years. Therefore, of the 543 deaths from Scarlatina, 512 died under fifteen years of

age; none died over fifty years of age, and only 24 over the age of fifteen years.

This disease was very prevalent in the county of Grey, 87 deaths, or 14.8 per cent. were reported. It also prevailed to a large extent in the county of Oxford—44 deaths or 7.3 per cent. Essex returned 33 and Huron 28 deaths from this cause. It stands eighth in the ten highest causes of death, but does not appear at all in the lists for the

cities and towns. More males than females died from this disease.

Diarrhea caused the death of 497 persons (264 males and 233 females). July, August, and September, generally the hot months of the year, were the most fatal. These three months returned a mortality of 347, or 70 per cent, while October returned only 47 deaths from this cause. The number of deaths in the other months, with the exception of February, which only returned 6, ranged from 13 to 19. Two hundred and ninety-two, or 58 per cent. of these decedents were infants under the age of one year, and 108, or 21 per cent., were between the ages of one and five, so that 400 of the 497 deaths—80 per cent.—were children under five years of age. Of the remaining 97 deaths, 64 were of old people, whose ages were between 50 and 90 years and over.

The county of York returned 76 deaths from Diarrhea, or 3 per cent. of all the deaths in the county; Wentworth 42, or 3·9 per cent.; Stormont, Dundas, and Glengarry, (United) 20, or 3·7 per cent.; Middlesex, 38, or 3.4 per cent.; Kent 19, or 3·2 per cent.; Carleton 47 or 3·1 per cent. The lowest returns were from the counties of Haldimand, 4, or 1·7 per cent.; Norfolk, 2, or 0·5 per cent.; Victoria, 3, or 0·9 per cent.; Welland, 3, or 0·8 per cent. The per centage of all the deaths from this cause to the total deaths from all causes, was 2·3 per cent. In the cities and towns it was 3·5 per cent. This larger proportion of deaths from Diarrhea in the cities and towns was no doubt cansed to a great extent by the use of impure water and unripe fruit. Toronto returned 70 deaths, 4·0 per cent.; Hamilton, 28, or 4·4 per cent.; Ottawa, 40, or 3·2 per cent.; London, 20, or 6·3 per cent.; Kingston, 11, or 3·5 per cent.; while the towns of Strathroy and Pembroke returned 3 and 6 deaths respectively, or a per centage of 10·3, and 11·1 per cent. from this cause, so that the mortality from this disease was proportionally greater in these two towns than in the cities above mentioned.

This disease stands ninth in the list of the ten highest causes of death in the

Province, and sixth in the list of the cities and towns.

Croup.—Four hundred and sixty-nine deaths from this disease were registered in 1882, (255 males and 214 females). The first four months returned 226 of these deaths, nearly one-half the whole number. In 1881 the last quarter of the year was the most fatal. Nearly all died young, 449 of the number were children between one and ten years. The deaths from this cause were not numerous enough to give it a place in the list of ten highest causes of death. More males died than females.

Cholera Infantum.—There were 363 deaths registered from this cause, 184 males and 179 females. The three months, July, August and September, together, returned more decedents than all the other months combined. July returned 65, August 133, and September 96—in all 294. All but 2 died under five years of age. The males numbered 5 more than the females. No other disease in this class calls for any particu-

lar notice.

CLASS II.—Constitutional Diseases.—The most important disease in this class is Phthisis or Consumption, it stands in 1882 at the head of the ten highest causes of death, as it has done for many years, and notwithstanding all the efforts to arrest its progress it seems to be on the increase. There were 67 more deaths from it in 1882 than in 1881, and, in consequence of the decrease in the total number of deaths returned, the rate per cent. was increased from 10·8 to 11·3 per cent. It affected both young and old, particularly the young, between 20 and 30 years of age. It spread through every month of the year, though with considerable variation. The spring months exceeded the other months to a small extent. March returned the highest number of deaths from this disease, 240, and August the lowest, 167, a difference of 73; 376 more females died than nales. The highest number of deaths from Phthisis was returned from the county of York, 267, but its per centage to the total deaths in the county was only 10·8 per cent., not equal to the average; the next highest was Carleton, with 149 deaths, or a per centage of only 9·8. Middlesex follows, with 127 deaths, or 11·5 per cent.; a little above the average. Wentworth was nearly the same, 120, or 11·2 per cent. These counties

have large cities within their boundaries. The following counties come next in numerical order, several large towns are within their boundary, but no cities; their death rate from Phthisis was very high. Northumberland and Durham (united) registered 103 cases, 14.9 per cent. of all the deaths; it was 15 per cent in 1881. Leeds and Grenville, (united) 96, or 14.8 per cent.; 15 per cent. in 1881. Huron, 90, or 13.1 per cent.; it was only 9 per cent. in 1881. Stormont, Dundas and Glengarry (united), 90, or 16.7 per cent.; against 13 per cent in 1881. Lincoln returned the highest death rate from this cause, 68, or 17 per cent.; in 1881 it returned 66, or 14 per cent. Prince Edward also had a very high rate, 51, or 14.6 per cent.; it was the highest in 1881, with 17 per cent. The following counties returned a low mortality from this disease: Renfrew, 19 deaths, or 5.8 per cent. of all the deaths in that county; Lambton, 28, or 6.5 per cent.; Perth, 39, or 7.6 per cent.; Grey 47, or 8 per cent.; Muskoka and Parry Sound, 25, or 8.7 per cent., and Halton 23, or 8 per cent. All these counties returned similar low rates in 1881, except Renfrew, which numbered

42 deaths, or 12 per cent.

This scourge of human life is evidently on the increase, a steady rise is noticed in every year since 1878; in 1879 the number was 2,065, in 1880, 2,154, in 1881, 2,397, and in 1882, 2,464; an increase in four years of 465, or 23 per cent. The great mortality from Phthisis, both in this and other countries, has been for some years the thought and study of the greatest scientists of the day, but so far their efforts have not been successful in devising means for checking the growth of this insidious and distressing malady. There were 804 deaths, or 11.9 per cent. of all the deaths, (6,752) from Phthisis in the cities and towns. Twenty-three of these places returned a higher rate. As usual, Toronto returned the largest number of decedents from Phthisis-208, or 12 per cent.—but this rate was exceeded by several cities and towns with less number of deaths. Ottawa was next in numbers, with 105 deaths, or 8.5 per cent.; Kingston returned 42 deaths, or 13.4 per cent.; London 36, or 11.4 per cent.; Guelph and Brantford each returned a death rate of 15 per cent. from Phthisis; St. Thomas reported the fewest deaths of any city, 5 deaths, or 6.1 per In many of the towns the rate was very high. Bowmanville had 16 deaths, or 25.8 per cent.; Perth 9 deaths, or 25 per cent.; Cornwall, 16, or 24.2 per cent.; Cobourg, 11, or 20.3 per cent.; Simcoe, 6, or 19.3 per cent. No deaths from this cause were returned from Milton or Welland, Pembroke and Sarnia only returned 2 each or 3.7 and 4.6 respectively; Whitby 3 or 6.9, and Napanee 3 or 10.3 per cent.

Females are more subject to Phthisis than males in nearly every period of life. In the following table this is plainly seen, as well as the prevalence of the disease in the various periods of life, and also the great mortality between the ages of 20 and 30 years.

### MORTALITY FROM CONSUMPTION.

Ancemia.—Under this heading are included all who died from Infant Debility, Atrophy, General Debility, and Degeneration. They were not so classed in the last Report; General Debility and Degeneration were, in many cases, included under Old Age. The deaths from Anæmia in 1882 numbered 1895, principally of children recorded as dying from Infantile Debility. 1,441, or 76 per cent., died under one year; and 202, or 10 per cent., died between one and five years of age; therefore, of the 1,895 deaths returned as dying from Anæmia 1,643, or 86 per cent., were children under five years. This was largely in excess of the number returned in 1881, and was chiefly caused by the large increase in the deaths from Infantile Debility returned from Ottawa. The three months, July, August, and September were the fatal periods to these infants, 199, 197, and 212, respectively having died in those months, making a total of 608, or 32 per cent. of all the deaths from that disease. The deaths in the other months did not vary to any great extent.

Dropsy and Cancer returned nearly the same number of cases—the first 393 and the second 397. Dropsy appears to be on the decrease, while Cancer seems to be advancing every year. These two diseases principally affect persons of middle and old age, 254 having died from Dropsy between the ages of 50 and 90—64 per cent. of all the deaths from this disease, while 266 died from Cancer during the same periods. Dropsy occupied the eighth place in the list of ten highest causes of death in 1879, since which time it does not appear on the list. Cancer in 1881 returned 313, in 1882; 397—an increase of 84, or 26 per cent. The mortality from these diseases was not very prominent in any one month of the year. More females than males died of Cancer, but in Dropsy the males and females were very nearly the same. No other disease in this class calls for any par

ticular remarks.

CLASS III.—Local Diseases.—In this class are grouped many important diseases, in their various orders. In the first order (Nervous diseases), Apoplexy, and Convulsions are found very similar in their action. They caused the death of 803 persons—449 males and 354 females; about the same number as in 1881. More males than females died from these diseases. Meningitis and Encephalitis—both diseases of the brain—caused the death of 526 persons, 268 males and 258 females. The deaths from these two diseases appear to have been confined in a great measure to children under five years of age, as 260, or 50 per cent. were registered as dying of those diseases at that period of life. The months of May, June, and September returned a larger number of deaths from Meningitie than the other months; and so do February and April from Encephalitis. More males than females died from these two diseases.

In Order 2 of this class (*Diseases of the Circulatory System*) diseases of the heart are the most important. The deaths from them are increasing every year. 828 persons are recorded as having died from the various affections of this organ of the body in 1882—404 males and 424 females. The deaths from Valvular Disease of the Heart were most numerous in the months of March, October and December; they returned respectively 77, 71, and 74—altogether 222, or nearly 30 per cent of all deaths from this cause. September and February were the months most free from deaths of this kind; they numbered 55 and 54. Between 50 and 80 years of age there were 392 deaths from this affection of the heart, 52 per cent. of all; therefore it may be called a disease of old age, though 38 deaths were registered

under five years of age. It is sixth in the ten highest causes of death.

Order 3.—Diseases affecting the lungs, chest, and throat, such as Pneumonia, Apoplexia pulmonalis, Bronchitis, and Laryngitis, are found to be the principal items of this order; together they returned 2,272 deaths—1,230 males and 1,042 females. March, April, and May, the three cold, wet, and windy months, proved very fatal to those affected with throat and lung complaints, no less than 893persons having died of them in those months; while in the hot, dry months of July, August, and September only 289 deaths were recorded. 523 infants under one year, and 383 between one and five years died from these causes, while 596 died between the ages of 50 and 80. Therefore they are to a large extent diseases of childhood and old age; the least fatal period was between 5 and 20 years—only 186 deaths took place at that time of life.

Pneumonia, the principal lung disease, stands fourth on the list of ten highest causes

of deaths. It has held the same position for many years.

Order 4.—(Diseases of the Digestive System).—Four of the principal diseases in this order are Dyspepsia, Enteritis, Gastritis, and Peritonitis, and are sometimes the results of inattention to proper dietary rules and conditions, therefore the number of deaths registered from these causes should act as a warning to those who neglect or infringe upon the demands of nature. There were 761 deaths, 412 males and 349 females registered in 1882 from these causes. The hot months of summer, returned the largest mortality, 225 having died in those months; October also returned as large a number—73. The deaths under one year were double those of any other period of age. The mortality was large between 20 and 30, being 79, and so also was it between 60 and 70, in which 76 died. The periods between 70 and 80, and between 10 and 15 appear to have been comparatively free from deaths of the digestive organs. Neither of these four diseases appear in the ten highest causes of death.

Order 5.—Diseases of the Urinary System.—Nephria and Nephritis, both affecting the kidneys, are the principal diseases in this order, they numbered 220, 141 males and 79 females, and were most prevalent in the fall and spring, they also attacked more old people than young. More males than females died of these diseases. Orders 6, 7, and

8 require no special comment.

Class IV.—Developmental Diseases of Children.—Order 1.—108 little on es lost their lives during the trying ordeal of dentition. There were 256 cases of still born, and 181 of premature birth, making a total of 437 who never really existed, or at least very temporarily.

Order 2 refers to Diseases of Women, and it is sad to find that 293 women died of diseases incidental to child bearing. The ages of these women were between 15 and 50

years.

Order 3.—Old Age.—General Debility and Degeneration, two causes of death heretofore entered under Old Age, are now, in accordance with the new classification, placed under Anæmia, consequently a less number of deaths were returned from Old Age, and it now stands third in the ten highest causes of death instead of retaining its usual place, second, a position it has held for ten years previous to 1882. Anæmia takes its place as second on the list. There were, however, 1,841 persons returned as dying from Old Age, 946 males, and 895 females. These deaths were of persons far advanced in life, who passed away apparently without any specifie disease, and probably were not attended by a physician in their last illness, and therefore their friends registered them as dying of Old Age.

CLASS V.—Violent Deaths.—These were either caused by accident, negligence or wilfulness on the person's own part or that of others. The total number of these deaths was 869, 692 males, and 177 females. 74 were from suicide, 59 males and 15 females, which is to be regretted, but the number is comparatively small in proportion to other countries. As railways multiply throughout the Province so will accidents through them increase. The increase was very great in 1882. In 1881 only 55 persons were registered as having been killed by cars, in 1882, 102 persons were so returned—nearly double the number.

Respecting those diseases which have not been particularly noticed in these cursory remarks, it is hoped that all interested in observing the rise and fall of the various causes of death, will study the minute and lengthy details given of every disease in the classification found in the tables of this Report. They have been compiled with great

care, and a very large amount of labour.

### TABLE 24.—DEATHS BY AGES.

(See Appendix, page clxxxiv to ccxlvii.)

### AVERAGE AGES AT DEATH.

### See Tables 24 and 25.

The average age at death of all who died in 1882 was 29.1 years (of males 29.8 years, of females 28.3 years). This is an increase in the length of life in the Province of nearly

one year over 1881. In the year 1880 it was 31.2 years.

The mortality of children, at and under one year of age, was not so great as in 1881, when 6,653 were reported as dying at those early periods of life, while in 1882 only 6,118 were so returned, a decrease of 535. This accounts, in a great measure, for the increase in the average length of life. The following counties exceeded the general average age of 29.1 years:—Halton averaged 35.8 years; Haldimand, 34.5 years; Lanark, 37.4 years; Leeds and Grenville, (united) 34.1 years; Lennox and Addington (united), 34.0 years; Northumberland and Durham (united), 35.2 years; but these counties returned a low death rate, some of them as low as 7 per 1,000; and further, none of them include large cities, where the deaths at and under one year of age are generally large, and which greatly influences the general length of life. In some counties on the contrary, where the average length of life was low, the death rate was large. Carleton, in which the average age was only 19.0 years, returned a death rate 23.6 per 1,000. Essex, with an average age of 23.1 years, had a death rate of 14.5. Wentworth, with an average age of 29.8 years, returned a death rate of 15.9, and the average age in the county of York was 23.9 years, with a death rate of 16.1 per 1,000.

In the cities and towns the length of life was less than the average of the whole Province, being only 24.1 years. In Ottawa the average was only 15.7 years, owing to very large mortality at and under one year of age, 694 deaths having occurred in those

periods of life.

When those who died under one year are deducted from the whole number of deaths, the average length of life is largely increased. For the whole Province the average was raised from 29.1 to 36.9 years; in the cities and towns from 24.1 to 34.1 years. In some of the cities and towns the increase was much larger. In Ottawa, after deducting 575 deaths under one year, the length of life of the remainder was raised from 15.7 years to 28.6 years. Toronto, by the same means, increased from 21.3 years to 31.8 years, the number of deaths under one year being 530. London increased from 25.0 to 37.2 years, the deaths under one being 106, or nearly 34 per cent. The town of Milton had the largest increase, by this deduction; the average age rose from 29.8 years to 46.1 years, an increase of 16.3 years, although the deaths under one year were only 6, but these six deaths were 40 per cent. of all the deaths returned from this town. Other towns were similarly increased. Goderich from 35.0 to 46.3 years, Brampton from 32.6 to 42.8 years, Chatham from 24.3 to 34.2 years, Sarnia from 20.9 to 30.2 years, and Pembroke from 20.6 to 29.5 years. Sandwich reported no deaths under one year, therefore the average age remains the same, 17.8 years.

Every year a number of persons are reported to be 100 years, and over, at the time of their death. Twenty-six such cases were reported in 1882. Enquiries made respecting these centenarians have hitherto failed to establish satisfactorily the truth of these advanced ages. In the nationality of decedents over sixty years of age, in every period from that age to 100 years, the Irish largely predominated. They numbered 1,612 out of a total of 5,065, nearly 32 per cent. English and Canadians are nearly the same, 968 and 989 respectively. The Scotch followed, with 790, and those of American birth numbered 342. Out of 26 who were reported as being 100 years, and upwards, at the time of their death, 11 were born in Ireland.

TABLE 28.

DEATHS BY OCCUPATIONS (for General Table see Appendix, page ccxlviii to cclxxvii.

Over the Average Age, 57 years.

OCCUPATIONS.	No. of Deaths.	Average Age at Death.	OCCUPATIONS.	No. of Deaths.	Average Age at Death.

### REMARKS ON DEATHS BY OCCUPATIONS.

### (See Table 28.)

The average age at death of those whose occupations were given was one year greater in 1882 than in 1881. The average for several years was as follows:—

For	1873	it was
66	1874	"55.2 "
66.	1875	"no report.
66	1876	"55.7 years.
66	1877	"
66	1878	"
66	1879	"
66	1880	"
"	1881	"56 nearly.
66	1882	"57 years.

There were registered in 1882 the deaths of 5,289 persons, who at the time of their death were following some occupation. Three thousand and forty-nine, or more than one-half of them, lived to be over the average age, 57 years. Conspicuous amongst them were Pensioners, Gentlemen, Farmers, and Public Officials. They numbered 2,796, with an average age of 65.5 years; an enviable class to belong to. They are those who generally do not have to contend with the worries and cares of business, or with the hard struggles and heavy toil of those who work for a living in cities and towns. Clergymen alone in this list of persons dying above the average age were brain workers. Merchants and professional men, as a class, die before arriving at the average age of life.

TEN OCCUPATIONS GIVING THE HIGHEST AVERAGE AGE AT DEATH.

### (See Table 29.)

In this comparative list some changes have taken place since 1881, "gentlemen" held the highest place with an average age of 70 years in 1881. In 1882 mill-wrights took their place with an average age of 74.8 years, but only five of this occupation died, whereas the deaths of 170 gentlemen were recorded at an average age of 68.2 years; they are now fourth on the list. Masons are seventh with an average age of 64.4 years, they were third in 1881 with an average age of 66 years. Provincial Land Surveyors, who were fifth in 1881, have dropped out of the list altogether in 1882. Gardeners retain the same place, but with an increase of two years in their average age. Clergymen, Shoemakers and Tanners and Curriers, who held respectively in 1881, the seventh, ninth and tenth places in this list, do not appear in 1882; fewer of them died, and their average age was not as large as in 1881. Farmers have also retrograded to some extent, they formerly held the eighth place, but in 1882 they were last, their average age, however, was nearly two years longer.

### TEN OCCUPATIONS GIVING THE LOWEST AVERAGE AGE AT DEATH.

The lowest average age of any calling in 1882 was that of Students, twenty-six years; in 1881 Telegraph Operators were the lowest. Students lose that appellation when they have finished their studies and entered their profession, therefore those who died while they were pursuing their studies died young. Milliners, Artists, Lumbermen and Editors do not appear on this list in 1882, their places have been taken by Students, Female Teachers and Domestic Servants. Printers were seventh on the list in 1881 with an average age of thirty-six years; in 1882 they were fourth, with only thirty-two years, a decrease of 4 years in their average ages. All these callings which exhibit so low an average length of life may be considered prejudicial to longevity. Over-study, it is well known, causes many deaths in early life, and that was probably one of the causes why Students appear in the list with so low an average age at their deaths. The length of the

lives of Female Teachers was shorter than that of Male Teachers. The hardships incidental to a life of teaching weigh more heavily on females than males, especially in cities and towns where they have to encounter more densely crowded rooms through a larger attendance of children, than their fellow Male Teachers, the younger ones being invariably placed under their charge and consequently their work is more wearing and exhausting. Their average age at the time of death was thirty-six, while that of Male Teachers was fifty-two years.

The occupation of a Seamstress is not thought to be conducive to good health, and consequently it is found that in every country their average length of life is low. In 1882 their average age was 32.7 years, in 1881 it was 40 years, a decrease of over seven years. This was probably caused by more being engaged in that work, as there were eleven more

deaths in 1882 than in 1881.

Domestic Servants Milliners and Dressmakers Seamstresses	. 16	1901 589 883	36.6 36.8 32.7

This classification of Deaths from Occupations excludes farmers' wives and housewives, which lowers the average age slightly. Including all, the average age is 57 years,

without these decedents it is 56.7 years.

Cultivators of the soil were six less in number in 1882 than in 1881, but their average age has increased from 60 to 61.9 years. Mechanics and Labourers' ages were the same as in 1881. Merchants were slightly less. Professional Men's average age was nearly the same. "Other employments," and "Females at work," returned a lower average. age age, particularly the latter, whose ages have decreased from 38 to 35.5 years.

Class I. Furmers and Gardeners.—They both returned increased average age at leath, which shews how conducive to long life these outdoor employments are, and yet it

s observed that the desire for leaving them for city employment is increasing.

CLASS II. Mechanics.—This list embraces 34 different trades. The most numerous are Carpenters, 173 having died at an average age of 54 years. 94 Shoemakers died, at 55.8 years. The four trades, Carpenters, Shoemakers, Blacksmiths, and Tailors together returned 389 deaths or 43 per cent. of all the mechanics who died in 1882; their average age was 55.3 years, a very fair length of life for those trades. Tailors were the longest lived, their average age in 1882, was 63 years, though in 1881 it was only 54 years.

The following Mechanics returned a low average age: Tobacconists, 30 years; Prin-

ters, 32 years; Barbers, 37 years; Moulders, 36 years; and Sawyers, 36.7 years.

16 out of the 34 Mechanical trades returned more than the average age of the whole

class, 52.0 years, and 18 a less average age.

Masons and Weavers are long lived, they generally reach the highest age of any in this class. In 1882 their average age was nearly 70 years. Millwrights returned a higher age, 74 years, but it is exceptional, they are few in number, and their ages vary

CLASS III. Labourers of which there were only three kinds viz.: Labourers, Pedlars, and Teamsters; they numbered 769 with an average of 52.7 years, somewhat larger than Mechanics. Teamsters are the shortest lived in this class, their average age was only 44

years. CLASS IV. Merchants, Financiers, Agents, &c.—This class returned a low average age, 45.9 years, the lowest of any class, except females. Book-keepers, Salesmen, and Clerks, are included in this class, they had the lowest average age in this class: 35.9 years. The confinement attendant on these occupations no doubt tends to shorten life. The average age of manufacturers was over fifty-four years of age. They are not so much confined indoors as Book-keepers and Clerks, their work is not so much of a sedentary nature and it calls for considerable muscular action, which tends to lengthen life.

The average age of Telegraph operators is always low. In 1881 it was 25 years, in 1882 28 years, an increase of three years. Those who follow this occupation seldom continue

at it many years.

CLASS V. Professional Men.—Their average was 58.5 years. With the exception of the cultivators of the soil, they are the only class that return an average age equal to, or greater than the general average, 56.7 years. The three professions (we might add a fourth, Teachers) Law, Divinity, and Medicine, are included in this class; they numbered together 100, exactly the same as in 1881, but their average age is higher—55 years. In 1881 it was 53.9. Clergymen seem to outlive the other professional gentlemen, their average age was 60.5 years.

CLASS VI. Other employments.—The persons included in this class are, with the exception of pensioners, those who are liable to violent deaths, and therefore their average

age is comparatively low.

CLASS VII. Females at work.—This class returned the lowest average age of any class, 35-5 years. Two of the occupations in the class, Milliners and Seamstresses, always. return a low average age at death; but why domestic servants should do so, is not. easily explained.

TABLE 31.

### DEATHS BY OCCUPATIONS.

### DEATHS BY OCCUPATIONS.—CAUSES OF DEATH.

This List contains the same diseases, with one exception, as in 1881. Enteritis took the place of Lung Disease. In 1881 a large number of persons were returned as dying from affection of the Lungs, and as no distinct form was given, they were included under the simple heading "Lung disease." In 1882 in consequence of the introduction of the new classification of diseases, they were registered under their appropriate headings, such as Pneumonia, Apoplexia Pulmonalis, etc, and this explains why the number of deaths from Pneumonia was so much larger in 1882, as a large number of deaths heretofore classified under Lung Disease being now included under Pneumonia. The total number of deaths in the whole Province in 1882 was considerably less than in 1881, a corresponding decrease is therefore observed in some of the diseases on this List. Heart disease and Apoplexy have fallen to 4th and 5th position instead of 3rd and 4th, which they formerly held. The decrease in the number of deaths from Apoplexy was caused by it being separated from Paralysis, with which it was formerly joined. Pneumonia and violent deaths took the place of those two diseases. All kinds of Fevers were enumerated under one head, "Fevers," in 1881; in 1882 they were separated into their various divisions, and only one kind, Typhoid Fever, takes a place on the List. Cancer has increased and it now occupies the 8th place instead of the last. Under the heading "Cancer" are included all the different varieties of this disease. Dropsy remains in the same position 9th on the list. It is pleasant to record that "Old Age" was the principal cause of death of these workers; but it is far from gratifying to find so many dying from Phthisis. Farmers, by far, outnumbered all other occupations and they also returned more deaths from consumption, 286 of them died from that disease, nearly the same number as in 1881; but it was only 11.4 per cent. of their deaths from all causes; while Seamstresses and Female Teachers returned 59.2 and 44.4 per cent. respectively. Bookkeepers and Clerks returned 30 per cent. and Blacksmiths, Carpenters, and Shoemakers over 20 per cent.; Merchants and Labourers had nearly the same, 15 per cent. Gentlemen returned the lowest death rate from this disease 8.8 per cent.; these persons, however, generally die at an advanced age; their average age at death in 1882 was 68.2 years; but the victims of Consumption generally die in early life. The ten occupations in this list returned in all, 560 deaths from this cause, which was 13.8 per cent. of the deaths from all causes.

I have the honour to be,

Sir,

Your obedient servant,

H. S. CREWE,

Inspector.
